

1. Day 1 of Kerecis treatment, two weeks after the eschar has been removed

2. Day 3: The wound is already responding well to treatment.

3. Day 7: Granulation has filled the wound bed.

4. Day 18: The wound is fully healed.

## Kerecis™ Omega3 Wound

Acellular, reconstructive tissue graft for tissue repair.  
Icelandic, piscine origin, Omega3 rich

### Case Review

## Obese smoker with diabetic foot ulcer treated with Kerecis™ Omega3 Wound

#### Patient description

77-year-old male.

Admitted to hospital with heart failure.

Obese smoker with diabetic necrotic foot ulcer on the plantar side of his right foot.

The ulcer was over 8 weeks old.

#### Treatment

Eschar removed.

Treatment with Kerecis™ Omega3 Wound initiated.

The wound responded well to treatment and healed in 2.5 weeks.

Keracis Omega3 is intact fish skin that is rich with naturally occurring Omega3 polyunsaturated fatty acids and is used to regenerate damaged human tissue. When inserted onto damaged human tissue such as a diabetic ulcer, the acellular material recruits the body's cells from the wound perimeter. The cells are then incorporated into the acellular fish skin that then ultimately is converted into functional, living tissue. Studies have shown that cells and stem cells proliferate faster in this structure than in other materials such as mammalian-sourced materials.

Fish skin is similar to human skin in presentation and chemical composition, permeability and electric conductivity. Many patients have described relive from pain when using the product as covering exposed nerve endings can provide pain relief.
